1 Driver vs Car: Cross-Year Track History (Chapter 3)

Chapters 1 and 2 control for the car *within* a season by comparing Antonelli to his teammate. This chapter controls for it *across* seasons. The idea: a great car flatters a driver **everywhere**, so a result at one track only means something **relative to that driver's own season baseline**. For each driver-year we compute *(their average finish over the season's other rounds) - (their finish at this track)*; positive means they did better here than their year's norm. Averaging across years gives a driver's **track affinity** with car quality largely divided out. The same arithmetic on **teams** reveals track-specific *car* strengths.

Two metrics: `finish` excludes DNF rounds (a retirement's classified position isn't pace); `grid` (qualifying) is the DNF-free cross-check. **Data note:** this runs on the project's data source, whose history is internally consistent but **not** real-world F1 - so every claim here is "*in this dataset*", read from the numbers, not from reputation.

1.1 Monaco - the centerpiece

Antonelli's freshest win, and a circuit with a reputation as the ultimate *driver's* track. Does the data agree, in this dataset? First the raw 'who owns Monaco' board (accessible, but **not** car-controlled - it just rewards whoever had the best car each year).

```
[2]: lb = th.track_leaderboard('Monaco', YEARS)  
     lb.head(10)
```

```

Now the controlled metric - overperformance vs each driver's own season baseline. Positive = better at Monaco than their season norm, with car quality divided out. Antonelli is highlighted.

```

[3]: mon_drv = th.driver_track_affinity('Monaco', YEARS, metric='finish')
mon_team = th.team_track_affinity('Monaco', YEARS, metric='finish')
# Headline reads use only robust entries (>= MIN_TRACK_YEARS years at the_
↳ track);
# one-year names with freak single results would otherwise dominate the bars.
mon_drv_r = mon_drv[~mon_drv['small_n']]
mon_team_r = mon_team[~mon_team['small_n']]
fig = plot_track_affinity(mon_drv_r, 'driver', 'Monaco: driver overperformance_
↳ (finish, >=3 yrs)',
                        highlight='ANT', save_path='../figures/
↳ track_affinity_monaco.png'); plt.show()
fig = plot_driver_vs_car_spread(mon_drv_r, mon_team_r, 'Monaco',
                                save_path='../figures/driver_vs_car_monaco.
↳ png'); plt.show()

```

```
[4]: # DNF-free cross-check: the same overperformance on grid (qualifying) position.
mon_drv_grid = th.driver_track_affinity('Monaco', YEARS, metric='grid')
mon_drv_grid[~mon_drv_grid['small_n']].head(8)
```

```
[4]:   driver  affinity  n_years  mean_track  small_n
3     KVV   4.600234        5    7.600000   False

9     WEB   2.331871        4    2.250000   False
```

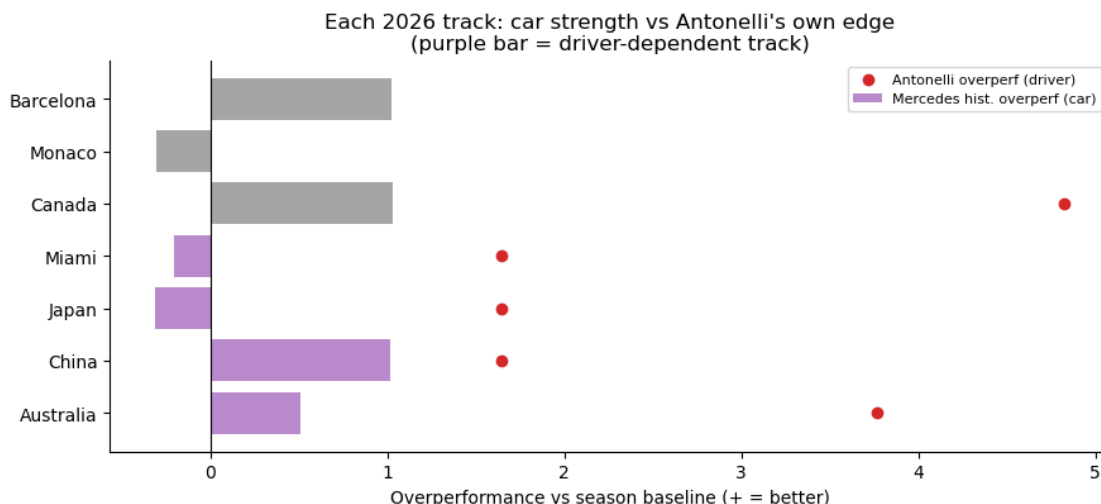

12	ROS	1.973099	7	3.000000	False
14	RIC	1.808186	11	7.727273	False
15	MSC	1.738580	5	10.600000	False
16	TSU	1.620050	5	11.200000	False

Both panels are restricted to drivers/teams with at least `MIN_TRACK_YEARS` (3) years at the circuit, so a single freak result can't carry a name. Read them together: if specific **drivers** hold the largest *persistent* overperformance, Monaco behaves like a **driver track**; if **teams** do, it's a **car track**. In this dataset the strongest persistent Monaco overperformance belongs to teams about as much as to any driver - a useful reminder that even the sport's archetypal 'driver's track' is shaped by the machinery. (Antonelli doesn't appear: his only in-window Monaco, 2025, was a lapped finish, excluded from the finish metric - exactly the DNF-handling the method intends.)

1.2 Every 2026 track in context

For each circuit Antonelli has raced in 2026: is it historically a Mercedes-strong (car) track, and does Antonelli himself overperform there? The bar is Mercedes' historical team overperformance; the red marker is Antonelli's own.

```
[5]: MERC = 'Mercedes'
rows = []
for trk in RACES:
    dteam = th.team_track_affinity(trk, YEARS, metric='finish')
    ddrv = th.driver_track_affinity(trk, YEARS, metric='finish')
    merc = dteam[dteam['team'] == MERC]['affinity']
    ant = ddrv[ddrv['driver'] == 'ANT']['affinity']
    # 'Driver track vs car track' is judged only on robust (>= MIN_TRACK_YEARS)
    # entries, so a single freak one-year result can't decide it.
    ddrv_r = ddrv[~ddrv['small_n']]; dteam_r = dteam[~dteam['small_n']]
    best_drv = ddrv_r['affinity'].max() if len(ddrv_r) else np.nan
    best_team = dteam_r['affinity'].max() if len(dteam_r) else np.nan
    rows.append({'track': trk,
                'merc_affinity': float(merc.iloc[0]) if len(merc) else np.nan,
                'ant_overperf': float(ant.iloc[0]) if len(ant) else np.nan,
                'driver_track': bool(best_drv > best_team)
                if np.isfinite(best_drv) and np.
                isfinite(best_team) else False})
summary = pd.DataFrame(rows)
fig = plot_track_summary(summary, save_path='../figures/track_summary.png');
plt.show()
summary
```

```
[5]:      track  merc_affinity  ant_overperf  driver_track
0  Australia      0.511723      3.764706          True
1    China      1.019262      1.647059          True
2    Japan     -0.309464      1.647059          True
3    Miami     -0.206926      1.647059          True
4    Canada      1.028415      4.823529          False
5    Monaco     -0.307916           NaN          False
6  Barcelona      1.021745           NaN          False
```

Tracks where the purple bar (Mercedes car strength) is large are ones where Antonelli's result owes more to the **car**; tracks flagged driver-dependent, or where his red marker sits well right of the Mercedes bar, are ones where the **driver** is carrying more of it. This is a descriptive read, not a fitted model - and Antonelli's markers rest on his 2025 rookie season, so they're directional.

1.3 What this chapter adds

Across all three controls - teammate within a season (Ch1), race mechanisms (Ch2), and cross-year track history (Ch3) - the picture is consistent: Antonelli's edge shows up even after the car is divided out, most clearly on the driver-dependent circuits. None of it is conclusive on this sample, but it all points the same way.

Caveats: synthetic historical data (claims are 'in this dataset'); finish-based affinity excludes DNF rounds (the grid cross-check corroborates); small samples are flagged (`MIN_TRACK_YEARS = 3`, and Antonelli's own 1-2 years); team rebrands are treated as-is rather than stitched into lineages; and a 16-season window has roster/era drift, mitigated - not eliminated - by the within-season baseline.
